Great optical illusion

This is a great simple [optical illusion](#). If you look at the two leaning towers, it appears the tower on the right is leaning more than the one on the right but in fact the two images are identical. I prove that the two images are actually the same by dragging the right image over the left one.

The animation might be better if the picture slid over wasn't completely opaque, so that you could see it slide right over the one below it.

yeah i know why it lookz different.

It's because the first picture is lower than the other two.

in the flash thing you'll notice that the picture thAt is moving will go downwards if you wait for it to play again.
